Subject: Application for the Forward Deployed Engineer position — CarbonFarm Technology

Dear Hiring Team,

I'm applying for the Forward Deployed Engineer role at CarbonFarm Technology. A role that sits between data, code and the clients who rely on the results is where I've done my most useful work, and applying it to the environmental outcomes of agricultural projects is a mission I can fully commit to.

Your posting asks for someone who can turn client needs into technical requirements and explain technical results to non-technical people. At Cleversys (later Deloitte), I took BI projects from client exchanges to Tableau dashboard presentations, and was the technical point of contact on an ERP migration for a client with €4B in revenue, leading specification workshops and implementing 62 accounting interfaces as complex SQL scripts. At INRAE, I helped researchers on an agrivoltaics project share their data through a common vocabulary, which taught me to listen to scientists and to the field before designing anything. Today, at TheMusicTree, I build Python and Polars pipelines that ingest MusicBrainz and Wikidata, run data-quality checks, and feed GrowTheMusicTree's PostgreSQL database of 30.9M songs, explored through a D3.js genre map. I operate the whole chain myself, from Ansible provisioning and orchestrated pipeline runs to Prometheus and Grafana monitoring, so following a workflow from data intake to final output and investigating where it breaks is familiar ground. I haven't yet applied machine-learning models in a professional setting, and that is the part of the role I'd be keenest to learn from your R&D team.

Environmental work isn't new to me. Beyond INRAE, I've spent time WWOOFing on organic farms and working on eco-construction sites, and I monitor the carbon footprint of my own web apps. I'm also used to spotting what keeps coming back and turning it into something reusable: at TheMusicTree I extracted shared Django and React packages once several apps needed the same logic, which is the same instinct as productising recurring delivery patterns.

I'm based in Paris, speak French and English fluently, and I'd be glad to discuss how I could help CarbonFarm deliver reliable results to its clients.

Best regards,
Andreas Garcia
